

Module Details		
Module Title	Forensic Taphonomy: the degradation of human remains and death-scene materials	
Module Code	ARC6013-B	
Academic Year	2024/5	
Credits	20	
School	School of Archaeological and Forensic Sciences	
FHEQ Level	FHEQ Level 6	

Contact Hours				
Туре	Hours			
Lectures	22			
Seminars	22			
Laboratories	8			
Directed Study	148			

Availability				
Occurrence	Location / Period			
BDA	University of Bradford / Semester 2			

Module Aims

This module provides a detailed understanding of the principles and practice relating to forensic taphonomy. This includes the degradation of human bodies and associated materials under a range of terrestrial and underwater environments.

Outline Syllabus

Introduction to depositional environments. Mechanisms of decay, including chemical and microbiological. Morphological and structural degradation of organic and inorganic materials. Complex microenvironments eg inhumation burials. Instrumental methods of characterising depositional environments. Design of taphonomic experiments. Methods of accelerated materials testing. Examination of degraded materials.

Learning Outcomes				
Outcome Number	Description			
01	Synthesize evidence of forensic taphonomy, soil biology, chemistry to interpret the degradation of human cadavers and a range of materials in the depositional environment.			
02	Evaluate the problems associated with forensic taphonomy and investigations of degradation mechanisms in both field and laboratory experiments			
03	Interpret theories of decay processes associated with the human body under a range of different depositional environments and explain the factors that will promote or retard soft tissue decomposition			
04	Synthesize the differences between transit graves, secondary burials, and 'no body cases' where a body has partially decayed and been subsequently moved.			
05	Evaluate written source material			
06	Set up a series of casework related experiments to aid the interpretation of results			
07	Record observations and experimentation, including experimental design, in a logical, comprehensive and contemporaneous manner in keeping with established and accepted codes of good practice.			

Learning, Teaching and Assessment Strategy

Lectures cover the key issues. Workshops and demonstrations explore specific topics of forensic

taphonomy, especially a critical approach to experimental design. Practical sessions and fieldwork

introduce both field taphonomic experiments and electrochemical corrosion. Students will use

Directed Study for reading of literature detailed in the module documentation and for

researching and preparing for coursework.

Mode of Assessment						
Туре	Method	Description	Weighting			
Summative	Coursework - Written	Critical literature review of a recently publshd paper in the context of related research & forensic practice (2000 wds)	50%			
Summative	Coursework - Written	Text based Submission (2000 words)	50%			

Reading List

Please note:

This module descriptor has been published in advance of the academic year to which it applies. Every effort has been made to ensure that the information is accurate at the time of publication, but minor changes may occur given the interval between publishing and commencement of teaching. Upon commencement of the module, students will receive a handbook with further detail about the module and any changes will be discussed and/or communicated at this point.
